

## JOHN DEERE R4038 SPREADER/SPRAYER | ALLIANCE 650/65R38

What do you do when you have two sprayers and they both have the same compaction issue? You fix the problem where the rubber meets the dirt.

In this case, a grower in southeast Wisconsin went to Mid-State Equipment, with his spreader and sprayer. Both were John Deere R4038 sprayers that came with standard row crop 380/90R46 tires. Unfortunately, both machines were experiencing compaction and flotation issues.

This one was an easy fix — and gave us twice as much satisfaction. CFI replaced the OEM tires and wheels with Alliance 650/65R38s, which immediately right-sized his tread footprint to solve problematic compaction problems. Our service and support made for one happy customer, and made seasonal seeding and spraying a breeze.
