

REDUCE COMPACTION THIS HARVEST

Performance comes first at CFI, and we'll do whatever it takes to get you the right equipment. Just ask Kent at Evolution Ag in Circleville, Ohio. When one of his customers wanted tires to put on a new Case IH 8240 combine, Kent knew who to call.

He turned to CFI Regional Sales Manager Kenny Seed. Because of the wet harvest in Ohio, Kenny knew that the Michelin 620/70R42 duals that were on the farmer's combine would cause too much compaction in the soil. For the customer to boost yield and minimize damage in the field, he would need something different. That's why Kenny suggested Firestone IF1250/50R32 flotation tires. Designed to leave a wide footprint and reduce compaction in muddy soil, these tires have all the qualities the combine needed for a successful harvest.
