

WHERE DO SALADS COME FROM IN THE WINTER?

A NARROW ROW CROP SOLUTION

About 90 percent of U.S. lettuce production is located in California and Arizona. With increasing demand for fresh salad every year, farmers have to find ways to improve their productivity to keep salad on our plates.

For years, CFI Tire has been providing vegetable growers with solutions that reduce damage and in turn increase crop yields. Giving farmers the best tire and wheel options to achieve optimum equipment performance is our major area of expertise.

Narrow row crop solutions are one of the many options that CFI can provide. This option was implemented with the John Deere 6125M & 7200R tractors as shown in the picture. Another satisfied grower.
